

**DEVICE AND METHOD FOR ELECTROLYTICALLY TREATING  
ELECTRICALLY INSULATED STRUCTURES**

**Abstract**

In order to permit continuous electrolytic treatment of small electrically conductive structures that are electrically insulated against each other on electrically insulating foil material, a device for electrolytically treating electrically conductive structures on surfaces of workpiece (1) that are electrically insulated against each other is provided, said device comprising: a) at least one arrangement, comprising at least one electrode (6) for contacting the work pieces (1) and at least one electrolysis region in a respective one of which at least one counter electrode (4) and the work pieces (1) are in contact with the processing liquid, b) the at least one contacting electrode (4) being disposed outside of the at least one electrolysis region and not being in contact with the processing liquid and c) the at least one contacting electrode (6) and that at least one electrolysis region being spaced so close together that small electrically conductive structures can electrolytically be treated.
